## Research Experience

### Princeton University

PHD CANDIDATE IN NEUROSCIENCE

Princeton, NJ

Sep. 2017 - Present

- Developed a gamified and psychometrically-validated battery of reinforcement learning & decision-making tasks to characterize learning and choice strategies in healthy and clinical populations.
- Devising & validating Bayesian factor models for the joint analysis of task- and self-report symptom data in a sample of N=1000 adult participants who completed the aforementioned task battery.
- Formalized clinical theories on the origin and maintenance of anxiety using Bayesian decision theory, and designed behavioral experiments to test novel predictions resulting from our models.
- Utilized item response modeling to validate and refine clinically-relevant behavioral and self-report measures, including a non-proprietary version of the Raven's progressive matrices and a retrospective assessment of childhood maltreatment.
- Built and released multiple open source softwares for the behavioral scientists, including an application for collecting online data and a collection of gamified decision-making tasks programmed with jsPsych.

### Massachusetts General Hospital / Harvard Medical School

CLINICAL RESEARCH COORDINATOR

Boston, MA

Jun. 2014 - Jun. 2017

- Lead analyst on study investigating the effects of DBS on executive control in patients with severe depression. Found that DBS improved patients' performance on a Stroop-like task, which was indirectly predictive of patients' clinical response to DBS.
- Devised hierarchical Bayesian model of decision making conflict, integrating both choice and reaction time data, in an approach-avoidance gambling task for use in predicting conflict-related signals in fMRI & EEG neural data.
- Adapted Bayesian state space models of associative learning to a reversal learning paradigm and demonstrated its efficacy in improving fMRI signal-to-noise ratio.
